

SITEMASTER 200® Not Connecting to Correct Data Set

Symptom: You install the program and/or you use the Change Data Set feature under Utilities menu. In Sitemaster the Data Set Path at the top of the screen displays the correct path, but the actual data in the program is not correct.

Cause: This seems to occur after performing a Windows Update. The result is that the ODBC drivers are “locked” to the previous data set even though the Data Set Path indicates the correct path.

Solution: Using the Control Panel (Vista, Windows7), select System and Maintenance, and then Administrative Tools. Select the Data Sources (ODBC) item, and under both the User DSN and System DSN tabs, remove the SM20030 drivers. Run Sitemaster.
